

General Motors has been seeing a continuous dip in sales for its cars since the advent of TESLA with its EVs. Tesla along with other players like Ford, and Chevy were also peddling heavily on GM and the latter have become predominantly slow in the market while Ford and Chevy also had their share of the pie.

The focus area was to manufacture electric vehicles along with **Internal Combustion Engines** as long as they could be supported and slowly migrate completely to only electric vehicles in the future. The goal is to become the pioneer in the EV industry just like the Internal Combustion Engines (ICE) industry. The blank check hence was provided for the idea of making electric vehicles and making it the top-most priority,

Electrical Vehicle was the go-to industry when it came to the car market. GM being GM the pioneer in internal combustion engines has come up with a great strategy for doing this. To pioneer the market in this area, particularly in cars, it has been decided that an investment of 30 billion USD would be made to better equip the GM factory to continue to work and manufacture electric vehicles along with internal combustion engines. The idea was to launch 30 electric models globally.

The plan was to launch GM Hummer EV which is a very popular model in Internal combustion engines. The 30 billion USD investment has brought the sinking company into the market yet again with its EVs playing a big role.

- General Motors (GM) is making a significant shift towards electric vehicles, with CEO Mary Barra leading the charge and declaring an "all-electric future."
- GM plans to invest \$30 billion in electric vehicles by 2025, aiming to launch 30 electric models globally, including the GMC Hummer EV.
- Despite GM's ambitious electric vehicle goals, Tesla currently dominates the U.S. electric vehicle market with a 66% share, while GM lags with just 6%.
- GM's electric vehicle lineup, based on the Ultium platform, includes models like the Cadillac Lyriq crossover, GMC Hummer pickup, and upcoming Chevrolet Silverado, Equinox, and Blazer electric versions.
- GM aims to overtake Tesla in electric vehicle sales by 2025, with executives projecting a doubling of annual revenue to \$280 billion by 2030.

General Motors CEO Mary Barra and her team have been working on an ambitious shift towards electric vehicles since 2017. The company has invested heavily in electric vehicle technology and plans to launch 30 electric models globally by 2025. Despite facing challenges such as slow production ramp-up and being outsold by competitors like Tesla, Barra remains confident in GM's potential to become a leader in the electric vehicle market. The company's Ultium platform, which has powered the launch of several electric models, is seen as crucial to achieving scale and lowering production costs. GM's commitment to an "all-electric future" has been met with scepticism from some investors and analysts, but Barra and her team are determined to prove them wrong. The company's efforts to streamline operations, battle supply constraints, and invest in battery production reflect its commitment to becoming a major player in the electric vehicle industry. Despite the challenges, GM's executives believe that their fleet of electric vehicles could position the company to overtake Tesla by 2025, and they are optimistic about doubling annual revenue to \$280 billion by 2030. Mary Barra's leadership and vision for GM's electric future are central to the company's transformation, and she remains committed to achieving these ambitious goals.

- General Motors CEO Mary Barra is confident that GM will surpass Tesla in EV manufacturing and become the leader in the EV market.
- GM plans to achieve this by building cheaper electric vehicles, with upcoming models priced at \$30,000 or lower.
- The company's current cheapest electric car is the Bolt EV, starting at \$31,500, while Tesla's entry-level Model 3 is priced at \$46,990.
- GM has launched or will be launching new-generation electric vehicles, with the most affordable being the Silverado EV Work Truck at \$39,900.
- GM's partnership with Honda is expected to bring truly affordable electric vehicles, including compact crossovers, to the market in 2027.

Mary Barra, the CEO of General Motors, is confident that the company will surpass Tesla in electric vehicle (EV) manufacturing. In an interview with Yahoo Finance, she expressed GM's ambition to become the leader in the EV market, aiming to sell more EVs than any other company, including Tesla, by mid-decade. Barra emphasized GM's strategy to offer affordable electric vehicles,

with plans to introduce a Chevrolet Equinox EV and a mystery electric vehicle priced under \$30,000. Currently, GM's cheapest electric car is the Bolt EV, priced at \$31,500, while Tesla's entry-level Model 3 starts at \$46,990. GM also plans to launch lower-priced electric vehicles in partnership with Honda in 2027. Despite Tesla's current lead in the global EV market, Barra is confident that GM will gradually close the gap, especially as more GM drivers transition from internal combustion engine vehicles to EVs.

- GM is transforming an all-electric future, with a focus on utilizing the talent and dedication of its employees.
- EV development and production share many similarities with traditional ICE vehicles, incorporating roughly 80% of the traditional manufacturing process.
- The Ultium Platform is a flexible and scalable vehicle architecture that serves as a game changer in EV technology, allowing for easy maintenance and incorporation of battery chemistry improvements.
- GM plans to offer EV versions of popular crossovers, pickups, and SUVs across its Chevrolet, Buick, Cadillac, and GMC brands, with a focus on expanding to offer more affordable models.
- Employees are driving the electric transformation through their adaptability, passion for innovation, and commitment to delivering great consumer experiences.

GM is undergoing a significant transformation towards an all-electric future, with a focus on embracing necessary changes and challenges while leveraging the talent, passion, and dedication of its employees. The transition to electric vehicles (EVs) involves utilizing many of the same skills, processes, and technologies as traditional internal combustion engine (ICE) vehicles, with EV manufacturing incorporating approximately 80% of the traditional ICE manufacturing process. The Ultium Platform, which underpins the GMC HUMMER EV and Cadillac LYRIQ, is highlighted as a flexible and scalable vehicle architecture that allows for easy maintenance and incorporation of battery chemistry improvements without significant changes to the platform. GM's commitment to an all-electric future extends to offering EV versions of popular crossovers, pickups, and SUVs, with plans to introduce more affordable models like the 2024 Chevrolet Equinox EV. The company's focus on reimagining the EV experience includes optimizing vehicle range without compromising performance, as evidenced by the forthcoming 2024 Chevrolet Silverado EV with an available 400 miles of range and up to 10,000 lbs of towing capacity. Throughout this transformation, GM emphasizes the crucial role of its employees, from engineers and designers to manufacturing team members, in driving innovation and delivering exceptional consumer experiences.
